About this report

The development and uptake of artificial intelligence (AI) has accelerated in recent years – elevating the question of what widespread deployment of the technology will mean for the energy sector. There is no AI without

energy – specifically electricity for data centres. At the same time, AI could transform how the energy industry operates if it is adopted at scale. However, until now, policy makers and other stakeholders have often lacked the tools to analyse both sides of this issue due to a lack of comprehensive data.

This report from the International Energy Agency (IEA) aims to fill this gap based on new global and regional modelling and datasets, as well as extensive consultation with governments and regulators, the tech sector, the energy industry and international experts. It includes projections for how much electricity AI could consume over the next decade, as well as which energy sources are set to help meet it. It also analyses what the uptake of AI could mean for energy security, emissions, innovation and affordability.

Tips for using the AI Agent

Understand the limitations: This agent has been trained on the content of the IEA's Electricity 2025 report to make it easier to explore and understand the analysis it contains. The agent has access to a general knowledge base for training purposes, but it cannot access additional sources materials or online resources. For detailed or official interpretations, please refer to the full report or contact the International Energy Agency.

Be clear and specific: Provide detailed and specific instructions to get the most accurate and relevant responses. For example, instead of asking "Tell me about electricity trends," try, "Summarize the key findings on electricity demand from the Electricity 2025 report."

Ask one question at a time: To ensure clarity and focus, ask one question at a time. This helps the agent provide a more precise and helpful response. If the response isn't what you expected, rephrase or refine your query to better guide the agent.

Provide context when needed: If your question relates to a specific section or chapter of the Electricity 2025 report, mention it in your prompt. For example, "Explain the latest trends for Africa in the Regional section of the Electricity 2025 report."

Specify desired format: If you need the response in a particular format

Specify desired format: If you need the response in a particular format such as a list or summary, mention it in your prompt. For example, "List the key points from the executive summary of the Electricity 2025 report."

Clarify region and timeframe: When asking for data, be specific about the region you are interested in. For example, "Provide data on electricity generation from renewables by year for Europe."

Use comparative analysis: Take advantage of the agent's capability to compare data across regions or timeframes. For example: "Compare trends in gas-fired power generation in Asia Pacific versus the Americas in the last three years."

Use natural language: Feel free to ask questions or make requests in a conversational manner. The agent is designed to understand and respond to natural language inputs. Use follow-up questions to dive deeper into the topics. For example, after asking, "What are the key trends in electricity demand," you may ask, "How do these trends differ across regions?" If you'd like to start a conversation anew simply say, "Start over".

Be patient: Complex queries may take a moment to process. Please be patient while the agent generates a response.
